

Innovation Health Group Launches Canada's First COVID-19 Immunity Passport

Toronto, Canada – March 8, 2021 – Innovation Health Group announced today the launch of an immunity passport app that will help Canadians who are looking for a safe and secure digital solution to help store their vaccination records.

The COVID-19 Immunity Passport app, the first of its kind in Canada, can be downloaded onto any Android or iOS smartphone and allows users to keep track and demonstrate their immunity status by uploading their vaccination records and subsequent antibodies testing.

Since the global rollout of the COVID-19 vaccines, various countries have developed their own methods of tracking and recording the vaccinations of their citizens. And a number of provinces, including Ontario, Manitoba and Quebec have all floated the idea of a vaccine passport, but this is the first app of its kind that will allow Canadians to determine their immunity status.

“The pandemic is accelerating our embrace of medical technology,” says Dr. Elaine Chin, founder of Innovation Health Group. “The use of a digital medical record that is secure and private, and managed by a third-party healthcare professional will be an important tool to help Canadians achieve true immunity by recording their vaccination documents, setting reminders for further doses, and testing for antibodies. This will ensure we can open up the economy safely and reduce the need for PPE over time.”

Right now in Ontario, people who have been vaccinated are receiving a thermal paper printout of their vaccination record, something that can be easily lost and degrades over time. The COVID-19 Immunity Passport app allows users to upload an image of their COVID-19 vaccination records by taking a photo of the document received at the time of the vaccination and adding key information including reminders for their second shot which could now be as long as four months from the first shot, as well as when they may need boosters against newer strains to stay on track with recommended future vaccination series.

Another key feature of the app is it allows people to get tested for COVID-19 antibodies once vaccinated, an important step in proving efficacy of the vaccine and ongoing immunity. Like the vaccine records, results of these tests can be uploaded to the app to further demonstrate immunity.

Health

The app is a critical and timely stopgap measure which uses a secure share-point solution so users can share those records with other family members, healthcare providers, and perhaps in the future, employers if required, until the Canadian government or provincial ministries of health develop an official document platform.

“With COVID vaccines now rolling out across the country we have entered a new, more hopeful phase of the pandemic,” says Dr. Chin, “and while many challenges remain, Canadians are looking for a privacy-preserving immunity passport app, or vaccine credential, to help us all get back to the new normal in a safe way.”
